

Some reactions from students who did there internetship at DMT

Student Edourd

I carried out my internship at DMT during summer 2010. The company gave me the opportunity to work on an industrial project even if I did not have experience. I worked on a biogas upgrading installation. The internship was separated into a practical part (launching the installation and regulate it) and a theoretical part (modify the dimensioning program of the absorption column). The project was very interesting and helped me to improve my knowledge in different fields as absorption and regulation. Besides, people from DMT were always very friendly and helpful. They followed my work the whole time but also gave me responsibilities which was very enjoyable.

To conclude I would say that this experience was very instructive and I am convinced it will be very useful for my future internships and jobs.

Student Fabien from France

I carried out my internship at DMT during summer 2010. I worked on both chemical and biological desulphurization of biogas. My tutor gave me the opportunity to work on several projects and to travel a lot (Barcelona, South of France, Groningen). I had no experience in biogas treatment but I had a lot of responsibilities such as starting a new plant alone which is very valuable. I did some practical work to do both maintenance and start-up of different installation but there was a lot of technical knowledge behind it. I created an excel sheet able to calculate every parameters of the biological biogas desulphurization.

My internship at DMT was very interesting and every people were friendly and very competent. It was a very nice experience and I recommend this company for every internship.
